ShipLog

Status that never goes down — active-active across regions.

Amazon Aurora DSQL · multi-region active-active

ShipLog

► shiplog-sandy.vercel.app · github.com/manojmallick/shiplog

THE PROBLEM

— Why this is hard

A status page that dies when its region dies is worthless exactly when you need it.

Multi-region writes normally mean conflicts or eventual consistency.

On-call teams need one consistent incident timeline from anywhere on earth.

THE SOLUTION

— How it works

1

Active-active

Aurora DSQL with peers in us-east-1 ↔ ap-southeast-1 — write from both at once.

2

Strong consistency

Strongly-consistent multi-region writes; survives any single-region failure.

3

Conflict-safe UX

Optimistic concurrency control with auto-retry on same-row edits.

ARCHITECTURE

— End to end

WHY AMAZON AURORA DSQL

DSQL used for the one workload it was built for: strongly-consistent writes from multiple regions simultaneously.

TECH & DIFFERENTIATION

— Built with

Next.js 16

TypeScript

Amazon Aurora DSQL

OCC

Vercel

WHY THIS DATABASE

DSQL used for the one workload it was built for: strongly-consistent writes from multiple regions simultaneously.

THE EDGE

Region-tagged writes + OCC auto-retry, with a clearly-labeled mock fallback so it runs with zero AWS.

TRACTION

— Live & shippable

Two-region incident timeline that stays consistent under concurrent edits — and survives a region outage.
